

QUESTION

Does prostate-bed target motion differ between the superior and inferior portions of the clinical target volume?

CASE EVIDENCE & RESPONSE

Original abstract

No statistically significant difference between the superior and inferior portions in anteroposterior, left-right, or superoinferior motion.

RESPONSE "No. The study supports this conclusion."

CRITERION REVISION

INITIAL · Evidence criterion

WEIGHT +6 → +5

The rationale accurately uses evidence stated in the supplied abstract to support the decision.

REVISED · Evidence criterion

Support “no” using the reported lack of a significant difference between the superior and inferior portions in anteroposterior, left-right, and superoinferior motion.

Counterfactual abstract

A significant difference between the superior and inferior portions appears in anteroposterior motion only; no significant difference appears in left-right or superoinferior motion.

RESPONSE "Yes. Significant differences appear in anteroposterior, **left-right and superoinferior** motion."

INITIAL · Overstatement penalty

WEIGHT -6 → -8

The response contradicts or materially overstates the supplied abstract.

REVISED · Overstatement penalty

Penalize contradiction or material overstatement, including false claims of significant differences between the superior and inferior portions in **left-right or superoinferior motion when the abstract reports a significant difference only in anteroposterior motion.**
